

CLAIMS

1 1. A debugger for use in assisting in the debugging of a program in a computer system, the debugger
2 comprising:

3 A. a thread identifier configured to, in response to a breakpoint event in connection with a
4 breakpoint in a thread which has caused an operating system to stop execution of all threads
5 in the program, identifies one of said threads which contained the breakpoint, and

6 B. a thread execution controller configured to, after identifying the one of said threads enable
7 others of said threads to continue execution.
